(54) Title: INJECTION MOLDING EQUIPMENT HAVING MOLDED ARTICLE EJECTOR, AND METHOD

(57) Abstract: Molding equipment for an injection molding machine and particularly adapted for ejection of a molded article from a mold core. Mold cores borne by a rotatable turret are brought into position in respective cavities formed in one or more mold halves. The turret and mold halves are so configured that when one core is in registration with the cavity of that mold half, another core carrying a previously molded article is positioned away from the mold halves for ejection of the article. The equipment includes an ejector having cooperating, molded article-engaging portions, at least one of the portions being moveable in a first direction to close upon another portion of the ejector to encounter the molded article, and the ejector portions, when closed, being moveable in a second, different direction to expel the molded articles from the cores upon which they were molded.
